>5.0	>5.4	95	¹ MCFARLAND 98	CCFR	ν N scattering

¹ MCFARLAND 98 assumed a flavor universal interaction. Neutrinos were mostly of muon type.

MASS LIMITS for Excited e (e*)

Most e^+e^- experiments assume one-photon or Z exchange. The limits from some e^+e^- experiments which depend on λ have assumed transition couplings which are chirality violating ($\eta_L=\eta_R$). However they can be interpreted as limits for chirality-conserving interactions after multiplying the coupling value λ by $\sqrt{2}$; see Note.

Excited leptons have the same quantum numbers as other ortholeptons. See also the searches for ortholeptons in the "Searches for Heavy Leptons" section.

Limits for Excited $e(e^*)$ from Pair Production

These limits are obtained from $e^+e^- \to e^{*+}e^{*-}$ and thus rely only on the (electroweak) charge of e^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the e^* coupling is assumed to be of sequential type. Possible t channel contribution from transition magnetic coupling is neglected. All limits assume a dominant $e^* \to e\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

¹ AAD 15AP search for e^* production in evens with three or more charged leptons in pp collisions at $\sqrt{s}=8$ TeV. The quoted limit assumes $\Lambda=m_{e^*}$, f=f'=1. The contact interaction is included in the e^* production and decay amplitudes.

¹ From e^+e^- collisions at $\sqrt{s}=183$ –209 GeV. f=f' is assumed.

² From e^+e^- collisions at $\sqrt{s}=189$ –209 GeV. f=f' is assumed. ACHARD 03B also obtain limit for f=-f': $m_{e^*}>96.6$ GeV.

² KHACHATRYAN 16AQ search for single e^* production in pp collisions at $\sqrt{s}=8$ TeV. The limit above is from the $e^*\to e\gamma$ search channel assuming f=f'=1, $m_{e^*}=\Lambda$. See their Table 7 for limits in other search channels or with different assumptions.

³AAD 13BB search for single e^* production in pp collisions with $e^* \to e\gamma$ decay. f = f' = 1, and e^* production via contact interaction with $\Lambda = m_{e^*}$ are assumed.

⁴ CHATRCHYAN 13AE search for single e^* production in pp collisions with $e^* \to e\gamma$ decay. f = f' = 1, and e^* production via contact interaction with $\Lambda = m_{e^*}$ are assumed.

⁵ AAD 12AZ search for e^* production via four-fermion contact interaction in pp collisions with $e^* \to e\gamma$ decay. The quoted limit assumes $\Lambda = m_{e^*}$. See their Fig. 8 for the exclusion plot in the mass-coupling plane.

Limits for Excited $e(e^*)$ from $e^+e^- \rightarrow \gamma\gamma$

These limits are derived from indirect effects due to e^* exchange in the t channel and depend on transition magnetic coupling between e and e^* . All limits are for $\lambda_{\gamma}=1$. All limits except ABE 89J and ACHARD 02D are for nonchiral coupling with $\eta_L=\eta_R=1$. We choose the chiral coupling limit as the best limit and list it in the Summary Table.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

>310	95	ACHARD	02 D	L3	\sqrt{s} = 192–209 GeV	

¹ ABDALLAH 04N also obtain a limit on the excited electron mass with $e\,e^*$ chiral coupling, $m_{e^*} > 295$ GeV at 95% CL.

Indirect Limits for Excited e (e*)

These limits make use of loop effects involving e^* and are therefore subject to theoretical uncertainty.

MASS LIMITS for Excited μ (μ^*)

Limits for Excited μ (μ *) from Pair Production

These limits are obtained from $e^+e^- \to \mu^{*+}\mu^{*-}$ and thus rely only on the (electroweak) charge of μ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the μ^* coupling is assumed to be of sequential type. All limits assume a dominant $\mu^* \to \mu \gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

$$>$$
102.8 95 ² ACHARD 03B L3 $e^+e^- \rightarrow \mu^*\mu^*$ Homodoublet type

 $^{^1}$ DORENBOSCH 89 obtain the limit $\lambda_{\gamma}^2\Lambda_{\rm cut}^2/m_{e^*}^2<2.6$ (95% CL), where $\Lambda_{\rm cut}$ is the cutoff scale, based on the one-loop calculation by GRIFOLS 86. If one assumes that $\Lambda_{\rm cut}=1$ TeV and $\lambda_{\gamma}=1$, one obtains $m_{e^*}>620$ GeV. However, one generally expects $\lambda_{\gamma}\approx m_{e^*}/\Lambda_{\rm cut}$ in composite models.

 $^{^2}$ GRIFOLS 86 uses $\nu_{\mu}\,e\,\rightarrow\,\,\nu_{\mu}\,e$ and $\overline{\nu}_{\mu}\,e\,\rightarrow\,\,\overline{\nu}_{\mu}\,e$ data from CHARM Collaboration to derive mass limits which depend on the scale of compositeness.

 $^{^3}$ RENARD 82 derived from g-2 data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

¹ From e^+e^- collisions at $\sqrt{s}=183$ –209 GeV. f=f' is assumed.

 $^{^2}$ From e^+e^- collisions at $\sqrt{s}=$ 189–209 GeV. f=f' is assumed. ACHARD 03B also obtain limit for $f=-f'\colon m_{\mu^*}>$ 96.6 GeV.

Limits for Excited μ (μ *) from Single Production

These limits are from $e^+e^- \to \mu^*\mu$ and depend on transition magnetic coupling between μ and μ^* . All limits assume $\mu^* \to \mu\gamma$ decay. Limits from LEP are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda - m_{\mu^*}$ plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

¹ RENARD 82 THEO g-2 of muon

² AAD 16BM search for μ^* production in $\mu\mu jj$ events in pp collisions at $\sqrt{s}=8$ TeV. Both the production and decay are assumed to occur via a contact interaction with $\Lambda=m_{\mu^*}$.

³ KHACHATRYAN 16AQ search for single μ^* production in pp collisions at $\sqrt{s}=8$ TeV. The limit above is from the $\mu^*\to\mu\gamma$ search channel assuming $f=f'=1,\ m_{\mu^*}=\Lambda.$ See their Table 7 for limits in other search channels or with different assumptions.

⁴ AAD 13BB search for single μ^* production in pp collisions with $\mu^* \to \mu \dot{\gamma}$ decay. f=f'=1, and μ^* production via contact interaction with $\Lambda=m_{\mu^*}$ are assumed.

⁵ CHATRCHYAN 13AE search for single μ^* production in pp collisions with $\mu^* \to \mu \gamma$ decay. f = f' = 1, and μ^* production via contact interaction with $\Lambda = m_{\mu^*}$ are assumed.

⁶ AAD 12AZ search for μ^* production via four-fermion contact interaction in pp collisions with $\mu^* \to \mu \gamma$ decay. The quoted limit assumes $\Lambda = m_{\mu^*}$. See their Fig. 8 for the exclusion plot in the mass-coupling plane.

¹ RENARD 82 derived from g-2 data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

MASS LIMITS for Excited τ (τ^*)

Limits for Excited τ (τ^*) from Pair Production

These limits are obtained from $e^+e^- \to \tau^{*+}\tau^{*-}$ and thus rely only on the (electroweak) charge of τ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the τ^* coupling is assumed to be of sequential type. All limits assume a dominant $\tau^* \to \tau \gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review D45 S1 (1992)).

MASS LIMITS for W_8 (Color Octet W Boson)

VALUE (GeV) DOCUMENT ID TECN COMMENT

• • • We do not use the following data for averages, fits, limits, etc. • • •

 1 ALBAJAR 89 UA1 $p\overline{p}
ightarrow W_{8}$ X, $W_{8}
ightarrow W_{g}$

Created: 8/2/2019 16:43

 1 ALBAJAR 89 give $\sigma(W_8 \to~W+{
m jet})/\sigma(W) <$ 0.019 (90% CL) for $m_{W_8}~>$ 220 GeV.

¹ ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color octet lepton is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. The limit improves to 99 GeV if it always fragments into a unit-charged hadron.

 $^{^2}$ ABT 93 search for e_8 production via e-gluon fusion in ep collisions with $e_8 \rightarrow eg$. See their Fig. 3 for exclusion plot in the m_{e_8} -A plane for $m_{e_8}=$ 35–220 GeV.

¹BARGER 89 used ABE 89B limit for events with large missing transverse momentum. Two-body decay $\nu_8 \rightarrow \nu g$ is assumed.

 $^{^2}$ KIM 90 is at $E_{\rm cm}=$ 50–60.8 GeV. The same assumptions as in BARTEL 87B are used.

³ BARTEL 87B is at $E_{\rm cm}=46.3$ –46.78 GeV. The limit assumes the ν_8 pair production cross section to be eight times larger than that of the corresponding heavy neutrino pair production. This assumption is not valid in general for the weak couplings, and the limit can be sensitive to its SU(2)_I ×U(1)_Y quantum numbers.
